NES AI FINANCE & INSURANCE INTELLIGENCE PLATFORM

Product Requirements Document

Document ID: NES-PRD-001 | **Version:** 1.0

Build approach: Cline-assisted development • Local-first Windows application

Scope: Personal research, paper trading and insurance document assistance

Goals, scope, workflows and acceptance criteria

1. Product Summary

NES AI Finance & Insurance Intelligence Platform is a local-first personal workspace for equity-market research, historical strategy testing, simulated paper trading, insurance-document understanding, policy comparison and AI-assisted explanations.

Problem and goals

- Bring trading research and personal insurance records into one coherent interface.
- Help non-technical users complete guided tasks without needing to understand every technical metric.
- Keep personal documents and local AI workflows on the user's machine by default.
- Provide traceable outputs with data source, freshness, assumptions and uncertainty.
- Build incrementally, validating the frontend before connecting real data sources.

In scope — initial release

- Responsive dashboard and navigation; hybrid light/dark themes.
- NSE/BSE equity research, watchlists, stock screener, indicators and historical backtesting, subject to authorised data availability.
- Paper trading only, with explicit simulation status.

- Local policy document vault, extraction review, term-life/health/vehicle categories, comparison and renewal reminders.
- AI Copilot for explanations and document Q&A;, grounded in available records.
- Local settings, backup/restore, reports, tests and diagnostics.

Out of scope — initial release

- Live broker order execution; automatic investment or trading decisions.
- Insurance purchases, policy issuance or claims guarantees.
- Customer-facing financial or insurance services.
- Guaranteed predictions, invented market values, or unverified insurer quotes.
- Sending personal documents to external AI services without explicit disclosure and consent.

Users and main workflows

Workflow	Success outcome
Analyse stock	User sees selected data, source/time, analysis and limitations.
Backtest strategy	User can reproduce a historical test with visible assumptions.
Paper trade	Only simulated orders are created and clearly labelled.
Understand policy	Extracted fields can be reviewed and corrected before verification.
Compare policies	Material coverage, exclusions, costs and missing data are visible.
Ask Copilot	Answer distinguishes facts, calculations, model output and general guidance.

Non-functional requirements

- Usable without WebGL or animations.
- Accessible keyboard focus and reduced-motion support.
- No API secrets in frontend bundles or normal logs.
- Clear loading, empty, success, error and retry states.
- Local-first storage defaults and tested backup/restore.
- Performance measured on target PC and a lower-power fallback device.

Release acceptance

- No dead navigation or misleading demo data.
- No live orders or insurance purchase flow.
- Important financial calculations have tests and documented assumptions.
- Document extraction is not treated as verified until reviewed.
- All major workflows include source/freshness/limitations where relevant.
