NES AI FINANCE & INSURANCE INTELLIGENCE PLATFORM

Software Requirements Specification

Document ID: NES-SRS-003 | **Version:** 1.0

Build approach: Cline-assisted development • Local-first Windows application

Scope: Personal research, paper trading and insurance document assistance

Functional and non-functional requirements

1. Purpose

This SRS translates the product goals into testable system behaviours for a local-first personal application. Requirements are implementation-neutral unless a technology is explicitly specified.

2. Functional requirements

ID	Requirement	Acceptance
FR-001	Navigation	All primary destinations and subpages open correctly.
FR-002	Theme	User can switch light/dark trading theme; contrast remains readable.
FR-003	Demo labels	Illustrative data is visibly marked and never labelled live.
FR-004	Screener	User can search, filter, sort and clear demo results.
FR-005	Watchlist	User can add/remove/reorder sample symbols in prototype state.
FR-006	Backtesting	Guided wizard validates required selections and displays assumption labels.
FR-007	Paper trading	Only simulated orders can be created; simulation status is persistent.
FR-008	Policy upload UI	Upload interaction shows processing/demo state without implying verified extraction.
FR-009	Field review	Extracted fields can be edited and explicitly marked reviewed in prototype.

ID	Requirement	Acceptance
FR-010	Policy comparison	Selected policies display comparable fields and missing-data indicators.
FR-011	Renewals	User can view and edit demo reminders; uncertain dates are marked.
FR-012	Copilot	Preset prompts return clearly labelled demonstration responses.
FR-013	Motion lab	All 12 animations can be replayed; reduced motion is respected.
FR-014	3D fallback	Core app works if WebGL is unavailable.
FR-015	Settings	Theme and motion preferences are controllable.
FR-016	Errors	Failed or unavailable states offer understandable messages and retry where appropriate.

3. Non-functional requirements

- NFR-001 Usability: beginner tasks use plain-language labels and guided steps.
- NFR-002 Accessibility: keyboard support, visible focus and reduced-motion preference.
- NFR-003 Privacy: no real sensitive documents in demo data; local-first intent documented.
- NFR-004 Security: no frontend secrets; validate data at boundaries when backend is introduced.
- NFR-005 Reliability: handle missing, stale and unavailable data distinctly.
- NFR-006 Performance: core UI loads without waiting for 3D; benchmark on target hardware.
- NFR-007 Maintainability: reusable components, typed contracts and domain logic separation.

4. Constraints and exclusions

- No live order routing or insurance purchases in the initial release.
- No live market feed until an authorised provider is selected and integrated.
- No claim that a demo AI response is a real model output.
- No cloud database or external AI integration in the prototype unless explicitly approved.

5. Acceptance test examples

- AT-01: User can navigate from Home to each major module and back without dead links.
- AT-02: Switching theme does not break text contrast or chart labels.
- AT-03: Paper trading page always shows the simulation-only banner.
- AT-04: Policy extraction UI requires review before marking data verified.
- AT-05: All animation demos replay and obey reduced-motion settings.
- AT-06: Disabling WebGL does not disable any functional workflow.
