NES AI FINANCE & INSURANCE INTELLIGENCE PLATFORM

Insurance Document & Comparison Rules

Document ID: NES-INS-013 | **Version:** 1.0

Build approach: Cline-assisted development • Local-first Windows application

Scope: Personal research, paper trading and insurance document assistance

Extraction, verification, comparison and claims workflow

1. Purpose

Define how the platform reads, reviews and compares policy documents while preserving traceability and uncertainty.

2. Supported categories

- Term life insurance.
- Health insurance.
- Vehicle insurance for car/two-wheeler.
- Other categories remain out of scope until a category-specific field schema is defined.

3. Document processing workflow

File selected → type/size validation → text extraction/OCR → extracted fields with provenance → uncertainty flags → user review/edit → verified record → comparison/reminders.

4. Field model

Field group	Examples / rules
Identity	Insurer, policy category, policy reference; mark missing or ambiguous values.
Dates	Start, expiry/renewal, waiting period dates; preserve source and timezone/date format.
Premium	Amount, currency, payment frequency, taxes if explicitly stated.
Coverage	Sum insured, covered members, benefits, limits and add-ons as applicable.
Restrictions	Exclusions, co-pay, deductible, waiting periods, sub-limits and conditions where present.
Provenance	Document name/page/section or extraction location when available.
Review	Unreviewed, corrected, verified by user, uncertain or failed.

5. Extraction rules

- Never silently convert OCR text into verified policy facts.
- Allow user correction and preserve the distinction between extracted and confirmed values.
- Do not infer an exclusion or benefit when it is not present in the source.
- Show unreadable or missing fields as unknown, not zero or “not covered”.
- Keep the source document available for verification where lawful and appropriate.

6. Comparison rules

- Compare like-for-like fields only and label non-comparable terms.
- Surface exclusions, restrictions, co-pay, deductibles, waiting periods and missing information—not only premiums.
- Show source document and date for each material comparison field.
- Do not create a single suitability score without transparent criteria and limitations.
- Do not invent insurer quotes, current prices or claim approval probabilities.

7. Claims assistance

- Provide a document checklist and relevant policy references.
- Clearly distinguish extracted policy clauses from general guidance.
- Do not guarantee claim acceptance or invent insurer-specific processes.
- Ask the user to verify deadlines and requirements with the insurer where source evidence is incomplete.

8. Privacy

- Use synthetic policies in the prototype.
- Keep local document storage as default in the intended application.
- Do not include full policy text or personal identifiers in logs.
- Make export, deletion and backup implications clear.
